

ABSTRACT OF THE DISCLOSURE

15

The invention relates to a device for using various types of coupling system to connect together a tube (2) and a filter housing (3). According to the invention, the device comprises:

20

- a head plate (21) independent of the type of coupling system, the head plate being fixed to the housing (3) and being provided with passages (22) opening out into a bearing face (23) of the head plate;

25

- for each backing-plate (P_i) of given type, a first bearing face (25) complementary to the bearing face (23) of the head plate (21) and a second bearing face (29) adapted to co-operate with a flange (B_i) of corresponding type;

30

- a sealing gasket (28) interposed between the first bearing face (25) of a backing-plate (P_i) of a given type and the head plate (21); and

35

- releasable connection means (30) between the head plate (21) and each backing-plate (P_i) of a given type in order to provide sealing between them.
